MECHANISMS of action

BERGAMOT: its flavonoids compete with the HMG-CoA reductase enzyme, responsible for the synthesis of endogenous cholesterol, leading to a reduction in blood levels. They reduce the transport of plasma cholesterol via VLDL lipoproteins by inhibiting the ACAT enzyme (Acyl-CoA cholesterol Acyl-transferase), they also reduce the synthesis of triglycerides by inhibiting the PAP enzyme (phosphatidic phosphohydrolase).

ACER CAMPESTRE: its buds perform a strong bile drainage action which determines an improvement in the metabolism of lipids, cholesterol and triglycerides.

CHAMAECRISTA NOMAME: its polyphenolic fraction inhibits pancreatic lipase, preventing the assimilation of fats. Nomalyses fat and cholesterol metabolism in the blood.
